

From Chatbot to Co-worker

Agent Introduction and Practice

LET AI BECOME YOUR TRUE COLLABORATOR

Agenda

- **Part 01:** What is an AI Agent?
- **Part 02:** Evolution Path from Prompt to Agent
- **Part 03:** How to Use Agents Effectively?
- **Part 04:** Security Awareness

You will learn

- What is an AI Agent
- From asking questions to letting AI do work
- Agent usage techniques
- How to build your own Agent

Part 1

What is an AI Agent?

Understanding AI Agents

From conversational AI to autonomous task-executing agents

Have you ever used AI tools?

Conversational AI vs AI Agent

Conversational AI (Chat AI)

Q&A Mode

You ask a question

It gives an answer

Then you execute it yourself

AI Agent

Agent Mode

You state a goal

It plans itself

It executes itself

It provides feedback

What is an AI Agent?

Three core capabilities of an AI Agent:

Perception

Read external information like
files, emails, webpages,
calendars

Planning

Break down large goals into
multi-step tasks

Execution

Operate tools—send emails,
run code, control browsers

Agent's Three-Layer Architecture

Layer	English Name	Core Responsibility	Typical Capabilities
Channel	Channel Layer	Receive and standardize external inputs	Parse message sources, extract context, route requests
Brain	Brain / Agent Loop	Understand goals and create execution plans	Task breakdown, step planning, tool selection, result evaluation
Execution	Body / Tools	Call tools and perform specific actions	File Read/Write, code execution, browser control, message sending

Coding Agent and Agentic AI

Coding Agent

Focusing on software development scenarios

- Read code - Write code - Run tests - Submit PRs

Representatives: Claude Code, Cursor, Devin, GitHub Copilot Agent

Agentic AI

Targeting broader business and life scenarios

- Research
- Book flights
- Make reports
- Send emails

Representatives: ChatGPT Agent, Manus, Claude Cowork, OpenClaw

Common point: From "answering questions" to "completing tasks"

Part 2

Evolution Path from Prompt to Agent

Evolution Path

Master the mindset shift from asking questions to getting AI to work for you

Four Stages

Stage 1

Questioner

Single-turn dialogue

Stage 2

Instructor

Multi-round +
Prompt design

Stage 3

Tool user

LLM + Tools

Stage 4

Agent user

Autonomous
planning

Comparison of the Four Stages

Stage	Mode	What You Do	What AI Does
Stage 1	Single-turn dialogue	Ask questions	Give answers
Stage 2	Multi-round + Prompt design	Write clear requirements, give context	Generate content, provide suggestions
Stage 3	LLM + Tools	Describe target, choose tools	Call tools, process results
Stage 4	Autonomous planning + Multi-step execution	Give goals and constraints	Autonomously break down, execute, provide feedback

Core Transitions of Each Stage

Stage 1 → 2

From "Asking randomly" to "Knowing how to ask"

Learn to give AI enough context and constraints

Stage 2 → 3

From "Chatting" to "Working"

Connect AI to real tools, not just text generation

Stage 3 → 4

From "Single-step execution" to "Autonomous completion"

Hand the goal over to the Agent, instead of monitoring every step

Which stage are you in now?

Most people are stuck between Stage 1~2

What really unleashes the value of Agent is mastering the thinking mode of **Stage 3 and Stage 4**

It's not about letting AI write for you, but letting AI work for you

Part 3

How to Use Agents Effectively?

Best Practices

Assigning tasks, providing tools, setting rules

Tip 1: Assign "Tasks", not "Questions"

Most people are used to asking AI questions

But what an Agent needs is:

Target

Context

Constraints

Inefficient Commands vs Efficient Commands

Inefficient Command	Efficient Command
"Help me write an email"	"Send an email to Teacher Zhang on my behalf, explaining my thesis defense is next Wednesday, ask him for feedback by 3pm Tuesday, with a formal yet friendly tone"
"Look up some info"	"Search for the top 3 domestic AI news of this week, summarize into a 200-word brief, and send it to my WeChat"
"Manage my schedule"	"Send me a daily schedule reminder at 8 AM every morning, if there are more than 3 tasks, help me rank them by importance"

GTCA Command Structure

G

Goal

What is the goal

T

Tools

What tools can be used

C

Context

Background information

A

Action

Expected output format

Tip 2: Let AI learn to use tools

MCP Tools

- Open standards - Connect external tools and data sources - GitHub, Notion, Slack...

Skills

- Reusable capability packages - Encapsulate workflow methodologies - PPT generation, financial report analysis...

MCP: Model Context Protocol

MCP is to AI what USB-C is to hardware

Core Features

- **Unified interface:** One protocol connects everything
- **Plug and play:** No need to write integration logic
- **Open standard:** Proposed by Anthropic

Common MCP Servers

- GitHub
- Notion
- Slack
- Linear
- Figma
- Database
- File System

Skills: Reusable Capability Packages

A Skill = Documentation (SKILL.md) + Optional scripts/templates/reference materials

Characteristics

- Loaded on-demand, does not occupy main context
- Composable, shareable, versionable
- Encapsulates professional knowledge

Typical Examples

- PPT generation
- PDF processing
- Financial report analysis
- Brand style writing
- Data visualization

MCP vs Skills

Channel for connecting external tools

- Connect real systems - Call external APIs - Access data sources

Encapsulated practical methodologies

- Knowledge and process - Best practices - Working patterns

How to use Skills well

Focus on single scenario

A Skill solves only one type of problem

Write clear trigger conditions

Clarify "when to use it"

Make good use of combination

String them together to complete complex tasks

Start with templates

Reuse official or community Skills

Make Your Own Skills

The greatest value of Skills is not using what others have written, but encoding your own workflow into it

```
my-skill/
├── SKILL.md      ← Required: Trigger conditions + Operational steps + Output formats
├── template.md   ← Optional: Output template
└── example.txt   ← Optional: Reference examples
```

SKILL.md Four-Part Writing Method

When to use

Trigger this Skill when the user needs to write a weekly

Goal

Generate a well-structured, focus-highlighted weekly repo

Steps

1. Ask what tasks were completed this week
2. Ask about next week's plans and current blockers
3. Organize into three parts: "Achievements / Next Week /
4. Formal tone, no more than 3 items per section, start w

Output format

Markdown, with heading levels, total words under 300

When to use

Tell the Agent when to use this Skill

- Clear trigger scenarios
- Prevent false triggers
- Ensure load in the appropriate context

Goal

Define what goal this Skill wants to achieve

- Clear expected results
- Evaluation criteria
- Alignment with user intent

Three-Step Start Method

Step 1

Identify recurring tasks

Find something you repeat every week

Writing reports, organizing meeting notes, sending follow-up emails...

Step 2

Deconstruct Prompt

Paste the Prompt you normally use

Break it into "Trigger conditions + Steps + Output formats"

Step 3

Test and iterate

Save as SKILL.md

Load in Claude, run it once, modify according to output

Skill Scenarios Suitable for Customization

Scenario	Skill Name	Core Value
Weekly Report	weekly-report	Unified style, eliminate formatting adjustments
Meeting Notes	meeting-notes	Automatically extract Action Items
Email Drafting	email-drafter	Maintain usual tone and signature style
Competitor Analysis	competitor-research	Fixed analytical framework, output is comparable
Book/Article Summary	article-summary	Unified summary structure, easy to archive

Tip 3: Instruction / Rule

If Skills are "an operations manual to the Agent"

Then Instruction / Rule is **"setting the rules for the Agent"**

For Claude Code / Cowork, it's `CLAUDE.md`

For OpenClaw, it's `CONFIG.md`

For Codex, it's `AGENT.md`

Instruction

Tell Agent who it is, what the goal is

Biased towards identity and role setting

Rule

Constrain the behavioral boundary of the Agent

Biased towards "what can/cannot be done"

Five Types of Common Rules

Type	Example
Identity Setting	"You are my personal work assistant named Xiaobai, familiar with my working habits"
Language Style	"Keep all replies in English, professional terms should stick to their original words, keep an objective and concise tone"
Output format	"Always put conclusion first in suggestions, followed by reasons, up to 3 points, numbered"
Behavior Boundary	"Don't initiate sending out any external messages, you must confirm the operation details with me before executing"
Priority Logic	"If I say 'Urgent', skip background analysis, supply executable plan straight away"

Complete Instruction Example

You are my personal efficiency assistant, named Xiaobai.

[Role]

You know my work background (Product Manager for a B2B SaaS product), familiar with my daily workflow, including writing PRDs, doing competitor analysis, preparing weekly reports.

[Style]

- Reply in English, brief and direct, don't use openers like "Sure" "No problem"
- Technical terms retain English abbreviations (e.g. API, DAU, MRR)
- Keep each reply under 200 words unless I ask for details

[Behavior Boundary]

- Involves sending emails, submitting documents and other external operations, must list operation content for me to confirm
- Do not actively recommend paid tools or services

[Priority]

- When I say "Urgent", give the plan right away, skip analysis
- When I say "Detailed", expand on all details and evidence

Four Principles of Writing Good Rules

1 Specific Over Abstract

"Short reply" is worse than "Reply no more than 150 words"

2 Positive Descriptions

Saying "Only do X" is more effective than "Don't do Y"

3 Don't Get Greedy

5 precise rules > 20 vague requirements

4 Constant Iteration

Update and iterate along with changing habits

Part 4

Security Awareness

Security & Safety

Minimum privilege principle, low risk first, periodic review

Three Security Principles

Principle of Least Privilege

Only give the Agent the permissions it truly needs

Test Low-Risk First

Test with non-sensitive tasks first before granting higher privileges

Periodic Review

Check what the Agent is doing rather than completely letting go

Summary

Core of AI Agent

**LLM Brain + Tool Limbs +
Memory System**

From "Answering Questions"
to "Completing Tasks"

Key to Using Agent

**Assign tasks + Provide tools
+ Set rules**

It's not about having AI write
for you, but having AI work
for you

Security First

**Least privilege + Low-risk
testing + Periodic review**

THAT IS ALL!

Starting today, let AI be your true collaborator
